                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a peptide epitope of human myocardium troponin T, which is recognised by a new anti-human myocardium troponin T monoclonal antibody. In an example from the specification, a hybridoma producing anti-human myocardium troponin T IGG monoclonal antibody was screened. An antibody used in human myocardium troponin T measuring system was selected. The epitope of human myocardium troponin T-specific antibody was analysed. An enzymatic immunoassay for troponin T-enal disease patient was carried out. The measurements in a chronic renal disease patient and a diabetes patient of normal heart function were examined. The effect of co-presence of skeletal muscle troponin T was evaluated. The anti-human myocardium troponin T monoclonal antibody is used in an immunoassay for the determination of troponin T in a solution. The method can determine troponin T exactly with no effect of skeletal
The invention relates to methods for selecting and identifying a cellular receptor for a virus, by immobilising, on a support, a monoclonal antibody targeted to a viral surface protein that determines attachment of the virus to the receptor. The immobilised antibody is
                                                                                                   Use of peptide(s) for facilitating or modulating attachment of adenovirus to cells - useful for, e.g. treating or preventing infection and improving uptake of gene therapy vectors
                                                                                                                                                                  WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                 Cellular receptor; virus; immobilisation; monoclonal antibody; fibre; viral surface protein; hexapeptide expression library; adenovirus; major histocompatibility complex; MHC; fibronectin; gene therapy;

In a reverse method, the viral surface protein is immobilised and incubated with the peptide library. In this case, the bound peptides are eluted by competitive binding with the monoclonal antibody. The hexapeptides AAW75336-W75345 represent peptides isolated by biopanning the library with the immobilised monoclonal antibody (MAb) 1D6.3 and eluted using an adenovirus type 5 fibre head protein (AAW75334).

The methods are used to identify peptides from MHC Class I and/or type III fibronectin proteins that allow or facilitate attachment by adenovirus (Ad) to host cells and/or entry into the cells, and to identify intention by the cells, and to

```

cellular receptor for a virus, by immobilising, on a support, a monoclonal antibody targeted to a viral surface protein that determines attachment of the virus to the receptor. The immobilised antibody is incubated with a hexapeptide expression library and peptides bound to the immobilised antibody are eluted by competitive binding with recombinant

The snails are cultured until cercaria of schistosome clones are produced. Transgenic clones are identified at the cercarial stage and maintained by sporocyst transfer. Laboratory animals are infected with one cercarium each. Transgenic schistosome clones that secrete high levels of the desired protein into the peripheral blood of the host are then identified. The method is used to produce therapeutic proteins in the blood stream of animals. Typical proteins to be produced include insulin, leptin, calcitonin, alpha 1 anti-trypsin, factor VIII, HIV cor-receptor ligands and cholesterol ester transfer protein inhibitor. Use of schistosomes as intermediate vectors for gene therapy facilitates mass production. It avoids another such as low efficiency constitutes and dose titration. It avoids another such as low efficiency constitute in the infection by containing the protein in the prot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         production of transgenic schistosomes for secretion of particular gene products. The method comprises cloning the protein coding portion of a cDNA corresponding to the gene encoding the protein of interest into a plasmid having upstream and downstream promoter/enhancer sequences, and containing 5' and 3' untranslated regions of a schistosome gene that is expressed in the integument, vitelline or Mehiis glands, or ootype of schistosomes. The transgene DNA is microinjected into the pronucleii or cytoplasm of the zygotes of stage I schistosome eggs and the eggs are cultured to maturity in vitro. Miracidia are hatched and snails are infected with one miracidium each. The snails are cultured until
                                                                                                                                                                                                         Fanconi; anaemia; disease; diagnosis; disorder; predisposition; tumour; cell cycle; cell activation; DNA repair; cytopaenia; treatment; effector; prevention; gene therapy; proliferative disease; therapeutic agent;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           problems, such as low efficiency, possible infection by contaminating replication competent virus, potential recombination with host DNA, possible malignant transformation and need to individualise treatments associated with use of viral vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             vitelline cell cDNA. The upstream primers (AAT60148-50) are bas drosophila TY3H amino acids 368-373, and the downstream primers (AAT60151-54) are based on drosophila TY3H amino acids 488-433 amplified sequences may be used in the method of the invention f
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Secretion of therapeutic proteins - into the blood of a animal host

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (9114732114 [95]AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli xL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Adaptor oligonucleotides were ligated to the blunt ends in higher screes. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (g1|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through 0.005 inch orifice at constant velocity. The sheared DNA

                                 binding to carrier), where one or more of valine residues of VP4 is substituted at positions 234, 236 or 255 by alanine, or subunits 240-248 of VP4 which is optionally modified to facilitate covalent coupling to a carrier other than VP6. Rotavirus VP4 subunit was found to be capable of plaque reduction when mixed with infection virus. The peptides are useful for initiating an antibody response in a mammal against rotavirus. The peptides are also useful as vaccines to protect against rotavirus infection. VP4 subunits are useful for prophylactic protection or for therapy with respect to rotaviral infection. AAB07553-55 and AAB07418 represent rotavirus VP7 proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-SEP-1988;

                                                                                                                                                                                                                                                                                                                        The specification describes peptides which are useful as immunochemicals. The peptides comprise subunits 40-60 of rotavirus viral protein, 232-255 of VP4 (both optionally modified to facility)

            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                              Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 88888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. CC (II) and (II) can have antibacterial activity and therefore can be used CC in vaccination. The nucleic acids (I) may be used to produce the CC s. epidermidis polypeptides (II) via the production of vectors CC containing them which are used to produce hosts cells which express the CC polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. CT mistry and therefore identify compounds that may be used for the ctreatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to CC AAH55090 represent oligonucleotide sequences and primers which are used CC Polynucleotide sequences from the present invention. AAH55091 to CC AAH55090 represent oligonucleotide sequences and primers which are used CC N.B. The present invention specifically claims all the polynucleotide sequence listing only goes up to SEQ ID NO:4454 so even CC though sequences are given in the disclosure for SEQ ID NO:4454 to 4472, and the componences are given in the disclosure for SEQ ID NO:4456 to 4472, and the componence is the present invention of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

The Bb polypepti can be used in vaccines for eliciting protective antibodies to memb the Borrelia genus, particularly for the use against Lyme disease i humans and animals. They can be used for preventing or attenuating infection caused by a member of the Borrelia genus. The products cabe used for detection of members of the Borrelia genus.
                                                                                     AAX20248 to AAX20402 represent polynucleotide sequences isolated fro Borrelia burgdorferi (Bb). Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borrelia belongs to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrelia causes epidemic ar
